

Computrition, Inc. is increasingly becoming the foodservice and nutrition care management solution of choice throughout the Hospitality and Healthcare Industries...

Since the clock struck 12 on January 1, 2006, Computrition, Inc. has received a groundswell of interest from non-commercial foodservice executives looking for state of the art software and technology to replace pre-existing legacy systems. In the past six months, Brigham & Women's Hospital, UNC Chapel-Hill Medical Center, UCLA Medical Center, Santa Monica Hospital, and the University of Southern California, as well as several other operations, have each selected to implement Hospitality Suite, Computrition's flagship product, as the replacement solution of choice from another competitive system.

The sources for this shift in automation are varied, yet it is evident that Computrition's products and services are providing value the competition may not. Through a truly innovative, integrated, and user-friendly Windows-based operating system, along with impeccable customer service in both application and technical support, as well as with comprehensive training and project management offerings, the industry seems to be realizing more and more that in selecting a superior back-of-the-house automated solution, Computrition is the company to beat.

There seems to be an industry trend and expectation that a solution provider must seek to be 'all things to all people,' but this simply does not seem to be the case. Instead of stretching both labor and fiscal resources to spread into new markets, or to develop new products, the Computrition team is focusing on continuing to enhance existing products. Computrition has always sought to be perceived as the diamond standard in the industry by which all technology providers and service levels are compared, and as these recent conversions represent, this goal is increasingly being met.
