# XCHANGE
GATEWAY

More and more, enterprise-class application users seek to provide endpoint integration into their core products as well as ancillary systems. With the wealth of data captured in these systems, there is often the need to transfer data amongst them to allow for deeper integration and a substantial reduction in manual processes. The **XChange Gateway** provides a communication mechanism between various third-party software systems and Computrition's solutions on a real-time basis. This exchange is performed seamlessly, from machine to machine, without the end users having to start a batch process or concern themselves as to how the data is structured or updated.

There are many products in the marketplace which claim to be the solution for application interoperability. Unlike many of these products, Computrition's XChange Gateway is genuinely vendor-neutral. Utilizing industry-standard XML, we offer open integration that allows for the ability to transfer data between Hospitality Suite and any preferred vendor. Computrition's Gateway solution is not dependent on third party middleware products, and it is supported and updated with every Hospitality Suite release.

UNIVERSALLY CHANGING THE BREADTH OF DATA EXPORTATION AND AVAILABILITY

HOW DOES IT WORK?

Rather than rely on any third-party protocols, the Hospitality Suite XChange Gateway communicates information using Web Service technology via a secure internal intranet, an encrypted private-to-public network, or the Internet. Computrition's XChange Gateway Products for Hospitality Suite transmit to and from other products using XML formatted messaging. In other words, this add-on application provides the most streamlined and accessible mechanism for bi-directional application communication.

GATEWAY TO ENHANCED APPLICATIONS

Computrition's XChange Gateway offers infinite opportunities to extend a higher level of knowledge and services to end users of the Hospitality Suite application as well as to customers served daily throughout one's foodservice operation.

> **The XChange Gateway enables us to interface HS recipe names and nutrient information to a digital menu board... The information (displayed from the menu boards) is pulled directly from HS so nobody has to manually change the boards on a regular basis. As long as your menus are up-to-date in HS and your nutrient information is up-to-date, this information will interface through a simple file.**
